

Forklift Fork Positioners

Forklift Fork Positioners - The fork positioner is actually a hydraulic device that can allow the driver to be able to control the lift truck without leaving the seat. They are made out of top quality materials and are intended to withstand the most challenging operations and work environments. Side shifting models have the extra ability to laterally position the entire load or the arms in order to facilitate more precise lifting and placement in a faster and much more effective method.

The unique fork pocket design could enable the person operating it to be able to securely sway the unit's blades without any fear of damaging the positioning cylinders. This allows the operator the choice to either execute independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on available units.
